LEV FITNESS WEARABLE

Continuous health tracking from an ankle band that disappears against your skin.

DISCREETNESS

MOVEMENT ACCURACY

THE UNMET WANT

People want the gold standard of motion data *and* the freedom to wear technology invisibly. No existing device delivers both. **Lev Does**

POD

18mm × 13mm × 7.5mm nestles into the natural hollow behind the medial malleolus. Invisible under any sock or trouser. Zero added bulk, zero social signal.

BAND

9mm elastane-nylon knit. Laplace's Law–tuned to <20mmHg interface pressure. Worn all day, forgotten immediately — discreet by design, comfortable by physics.

DISAPPEARS FROM VIEW, REVEALS MORE DATA

01 · WHERE LEV SITS

Positioned directly over the **posterior tibial artery**, in the natural hollow behind the ankle bone, a spot the body already hides under clothing.

02 · WHY THE SIGNAL IS STRONG

That artery sits close to the skin, giving a **clean, clinical-grade pulse signal** with far less motion noise than a wrist in constant motion.

03 · WHY WRISTS AND FINGERS FALL SHORT

Fingers grip. Wrists rotate and flex. Both introduce noise. **Neither sits near the ground**, where gait actually happens.

04 · WHAT ONLY THE ANKLE CAN MEASURE

Cadence, stride symmetry, ground contact time, pronation: these come from the foot itself, not from a proxy on the wrist.

05 · THE CORE INSIGHT

The spot that hides Lev is the same spot that makes its data unmatched. **Discreetness and accuracy aren't a tradeoff; they're the same decision.**

$129

HARDWARE · ONE-TIME

LEV PRO **$7.99/mo** ($79/yr)

Advanced gait & movement analytics — stride symmetry, ground contact time, dorsiflexion angle, gait-phase detection.

Total pod cost (10 components)
approx. $49.12 per prototype quantity

Illustrative component breakdown — not literal component photography.

BUILT ON THE LIMB THAT ACTUALLY MOVES

PEER-REVIEWED EVIDENCE

31.2% VS. 1.5%
AVG STEP-COUNT ERROR: WRIST VS. ANKLE

Peer-reviewed: wrist-worn devices showed **31.2% avg error** vs. just **1.5%** for ankle. Ankle correlates with real step count; wrist does not.

DIRECT MEASUREMENT VS. PROXY INFERENCE

Whoop and Oura **infer** gait from arm motion. Lev measures directly at the source.

GROUND CONTACT TIME
Only measurable at the foot

STRIDE SYMMETRY
Direct tibial rotation, not arm swing

DORSIFLEXION ANGLE
Foot-phase detection at source

TRUE GAIT-PHASE
Stance, swing, heel-strike detected

12 HEALTH & MOVEMENT METRICS FROM JUST 2 SENSORS

Movement
- Steps
- Distance
- Cadence
- Gait pattern
- Calories burned

SLEEP
- Sleep stages
- Sleep duration

HEALTH
- Heart rate
- Heart rate variability
- Blood oxygen (SpO2)
- Respiratory rate

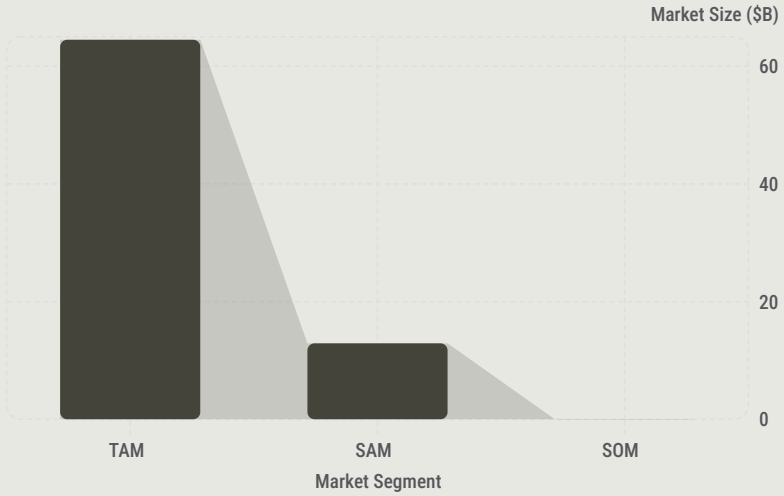

5–7 DAYS CONTINUOUS MONITORING · SINGLE CHARGE

Full charge in ~1 hour via magnetic pogo-pin dock (est.)

MARKET OPPORTUNITY: LARGE & DEFENSIBLE

Lev targets a substantial, growing market with a product that solves documented adoption barriers, built on proven foundations.

0.02%
Total conversion rate

TAM : ~500M global fitness-wearable users x $129 average selling price = $64.5B

SAM : ~20% of TAM (English-speaking, D2C reachable) = $12.9B
Source: Founder estimate

SOM (Serviceable Obtainable Market): 0.1% share of SAM (~100,000 units within 3-5 years) = $12.9M
Source: Founder estimate (conservative)

REMOVES ADOPTION BARRIER

Lev eliminates the most cited social barrier: device visibility and "identifiability." **29%** of consumers say today's trackers simply aren't attractive enough to wear.

PROVEN PRECEDENT

Lower-limb movement trackers (e.g., MilestonePod) are a validated product category. Lev brings in biometric measurements to the category.

INDUSTRY TAILWINDS

Entering a large, fast-growing market with wearables as a top trend. Wearable tech is ACSM's #1 fitness trend for 2026, growing at a 13% annual rate.

EXECUTION STRATEGY

PHASE 1 · NEXT 90 DAYS — BUILD THE PROTOTYPE

- Source and bench-test core components (PPG, IMU, MCU, PMIC)
- Fabricate first rigid-flex PCB; validate sensor + Bluetooth wiring
- 3D-print the pod enclosure to confirm fit on a real ankle

PHASE 2 · MONTHS 3–6 — FIRST WEARABLE UNITS

- Assemble 3–5 working pod-and-band units for hands-on testing
- Log step count & gait data vs. phone references to check accuracy
- Refine band comfort using feedback from track & tennis teammates

PHASE 3 · MONTHS 6–9 — PILOT TEST & OUTREACH

- Run a 10–15 student-athlete pilot during practice sessions
- Apply to more pitch competitions & STEM grants for next prototype run
- Publish real test data & a demo video to build early interest

THE BEST TECHNOLOGY IS THE TECHNOLOGY YOU FORGET YOU'RE WEARING.

FOUNDER

Founder: Yehuda Zaretsky
South Eugene High School: Senior

Solo founder. High school competitive tennis player. Engineered every component of Lev from first principles.

As a competitive athlete, I've spent years trying to maximize my health. I have grown a passion around fitness, nutrition and longevity that led to Lev.

> **PEOPLE WANT INVISIBLE HEALTH TRACKING *AND* ACCURATE MOVEMENT DATA. LEV DELIVERS BOTH**
